FEBS Lett. 52:161-161(1975).

-!- FEBN Lett. 52:161-161(1975).

-!- FUNCTION: INHIBITS BOTH CHYMOTRYPSIN AND TRYPSIN.

-!- SUBUNIT: HETEROGENEOUS TETRAMERS OF SIMILAR CHAINS.

-!- SUBUNIT: HETEROGENEOUS TETRAMERS OF SIMILAR CHAINS.

-!- SUBUNIT: HETEROGENEOUS TETRAMERS OF SIMILAR CHAINS.

-!- SUBUNIT: HETEROGENEOUS TETRAMERS OF A FACTOR FROM THE WOUND SITE. WITHIN THE LEAVES IT INDUCES THE CYTOPLASMIC SYNTHESIS OF PROTEINARE INHIBITORS I AND II.

-!- SIMILARITY: BELONGS TO THE POOTATO CHYMOTRYPSIN INHIBITOR I FAMILY OF SERINE PROTEASE INHIBITOR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Richardson M., Cossins L.; "Chymotryptic inhibitor I from potatoes: the amino acid sequences of subunits B, C, and D."; FEBS Lett. 45:11-13(1974).

-!- FUNCTION: THE BIOLOGICAL FUNCTION OF STREPTAVIDIN IS NOT KNOWN.
FORMS A STRONG NON-COVALENT SPECIFIC COMPLEX WITH BIOTIN (ONE
MOLECULE OF BIOTIN PER SUBUNIT OF STREPTAVIDIN).
-!- SUBUNIT: HOMOTETRAMER (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: BELONGS TO THE AVIDIN/STREPTAVIDIN FAMILY.

Mel. Biol. 279:211-221(1998).
- FUNCTION: THE BIOLOGICAL FUNCTION OF STREPTAVIDIN IS NOT KNOWN. FORMS A STRONG NON-COVALENT SPECIFIC COMPLEX WITH BIOTIN (ONE MOLECULE OF BIOTIN PER SUBUNIT OF STREPTAVIDIN).
                                                         -:- SUBCELLULAR LOCATTON: Secreted.
-:- SIMILARITY: BELONGS TO THE AVIDIN/STREPTAVIDIN FAMILY.
-:- DATABASE: NAME-ProZyme technical fact sheet.

fibropellin C precursor - sea urchin (Strongylocentrotus purpuratus)
NiAlternate names: ECF repeat-containing profedin; epidermal growth
NiAlternate names: ECF repeat-containing profedin; epidermal growth
C:Species: Strongylocentrotus purpuratus (purple urchin)
C:Species: Strongylocentrotus purpuratus (purple urchin)
C:Species: Strongylocentrotus purpuratus (purple urchin)
C:Accession: A48836
R:Bisgrowe, B. W.; Raff, R.A.
Dev. Biol. 157, 526-538, 1993
A-Title: The SpECF III gene encodes a member of the fibropellins: EGF repeat-containing
A:Reference number: A48836
A:Accession: A48836
A:Access
                                                                                                                                                                                                                                                                                                                                             Anylogic inhibitor I precursor - Peruvian tomato
C; Species: Lycopersicon peruvianum (Peruvian tomato)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 14, 18 Sequence 7, 18 Sequence 7, 18 Sequence 9, 18 Sequence 2, 18 Sequence 16, 18 Sequence 17, 18 Se

Patent No. 6312916
GENERAL INFORMATION:
APPLICANT: Kopetzki, Erhard; Muller, Rainer;
APPLICANT: Engh, Richard; Schmitt, Urban; Deger, Arno; Brandstetter, Hans
TITLE OF INVENTION: Recombinant Inactive Core
TITLE OF INVENTION: Streptavidin Mutants

constructed from a core streptavidin or avidin sequence are selected that differ from the native polypeptide by at least one amino acid and have a binding affinity for biotin of less than 1010 l/mole. The biotin-bindable polypeptide may be present as a polymeric conjugate, e.g. with another polypeptide or protein, especially bownes serum albumin. These muteins are used as anti-interference reagents for reducing and/or avoiding nonspecific interactions in a process for detecting an analyte. In specific binding pair is involved for qualitative and/or quantitative determination of an analyte in a test sample, e.g. a heterogeneous affinity for biotin, the muteins assay, Despite having a lower binding a sfinity for biotin, the muteins assay. Despite having a lower binding with native streptavidin and avidin.
                                                                                                                                                                                                                                                                                                            This sequence represents an avidin which is used in a novel method of reducing interference from non-specific binding in assays. Muteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  90 NKRTQPTFGFTVNWKFSESTTYFTGQCFIDRNGKEVLKTMWLLRSSVNDIGDDWKATRVG 149

This comprises Avidin mature peptide, a plant-noxious fusion protein. This comprises Avidin mature peptide, a plant-noxious protein. This comprises Avidin mature peptide, a plant-noxious protein. Gused to the PPI-I signal peptide. Transformation of plant genome with the vector encoding the fusion protein can produce pest resistance in plants, plant derived products and stored harvest material. Pests that can be controlled include, cotton bollworm, tropical army-worm, European corn-borer or red mitte, tobacco horn worm, loopers, rice stem borer, porina, cutworms, diamondback moth, potato tuber moth, codling moth, indian meal moth, gypsy moth, argentine stem weevil, grass-grubs, corn rockworm, rice and wheat weevils, maalworms, flour beetles, black field cricket, locusts, sawflies, Western flower thrips, Hessian flies or two-spotted mite.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                   The present invention describes a fibrinogen-converting enzyme fusion protein (FCE). The fusion protein is a multidomain protein comprising:

(a) a FCE; and (b) a first member of a binding pair, that is linked to the FCE chain: (i) directly by bonds utilizing the N-terminal amino groups, the C-terminal carboxy groups or side-chain functionalities;

(ii) Via a bifunctional linkage moiety linking the groups or functionalities; or (iii) by the first member be groups or member of the binding pair, where the second member of the binding pair is covalently attached to the first polypeptide chain. The FCE can be used in a method for producing fibrin. Fibrin is useful as a sealant in surgery to, e.g. reduce bleeding by sealing blood vessels, and tissues that have been dissected either in surgery or through wounding. The fusion protein allows for the removal of the fibrinogen converting enzyme from the fibrin sealant preparation via the binding of enzyme from the fibrin sealant preparation via the binding of strepteavidin to a biotin solid support. The present invention.

tetramer, where each of the four monomer units binds to one biothn.

Biotin is complexed with a neutral avidin (neutravidin), and then
covalently coupled with polynucleotides, to exemplify the invention. The
specification describes a composition of complexes of polynucleotide
molecules covalently coupled to ligand moleties that are specifically
bound to ligand binding molecules to form a cross-linked structure.
The composition allows incorporation of diverse oligonucleotides or
polynucleotides into a single complex for concomitant delivery into the
same cell. The method and compositions provide a new way of linking DNA
molecules and are useful for gene over-expression and non-covalent
cloning. The new system is called biotin-avidin networked gene (BANG)
system. It is possible that the BANG system can be used to link multiple
gene complexes to elicit broader immune reactions, e.g. as DNA vaccines.
The BANG system can also be used as a cloning tool. The BANG system also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Scavenger receptor class A; ScR; avidin; fusion protein; bovine; ECD; membrane-spanning domain; extracellular domain; biotin-binding activity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      present sequence represents an avidin monomer. Avidin exists as a

```
and a mutant bacterial streptavidin, which are capable of generating stable dimers with reversible blotin binding activity. These can be used in signal transduction studies, protein purification and immunoassays. The present sequence is the chicken egg white avidin protein.
                                                                                                                                                                                                                                                           The present invention provides a mutant chicken egg white avidin protein
                                                                                                                                                                             Avidin and streptavidin mutants comprising tryptophan 110 and tryptophan 120 respectively, substituted by lysine for use in all known avidin/streptavidin-biotin systems and a purification process
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chicken; egg white; avidin; bacterial streptavidin; mutant; mutein; dimer; biotin binding activity; protein purification; immunoassay;

Using the proteins or encoding nucleic acid molecules it is possible to target biotinylated molecules to specific sites in tissues. Molecules transpared in this way may be to exert their effects within or on the cell. This sequence represents a bouine scavenger receptor class A/avidin fusion protein which is used in

```
This sequence represents a mutant streptavidin protein isolated from Streptomyces avidinii where the residues ESAV at position 44-47 of the mature wild type sequence are replaced by VTAR. This sequence is used to produce mutants which are used in a method to assay the binding affinity of streptavidin mutants. These mutants have a mutation within the amino acid (aa) region 44-53 of the wild-type protein show a higher binding affinity than the wild-type for peptide ligands that include the sequence of formula Trp-X-His-Pro-Gln-Phe-Y-2 where X=any as; Y
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          "Wild type ESAV is replaced by VTAR. Numbering is from the start of the mature protein"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a mutant chicken egg white avidin protein and a mutant bacterial streptavidin, which are capable of generating stable dimers with reversible blottin binding activity, These can be used in signal transduction studies, protein purification and immunoassays. The present sequence is the Streptomyces avidinii streptavidin protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Avidin and streptavidin mutants comprising tryptophan 110 and tryptophan 120 respectively, substituted by lysine for use in all known avidin/streptavidin-biotin systems and a purification process
and Z are both Gly, or Y = Glu and Z = Arg or Lys. Recombinant streptavidin mutants can be used to isolate, purify and determine proteins or to determine/recover substances that contain streptavidin-binding groups. Such compounds may also be used to immobilise fusions on microtitre plates, microbeads or sensor chips. NOTE: This sequence does not appear in the specification but has been constructed from the wild-type Streptavidin sequence represented in AAV34714.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The synthetic gene is constructed from 24 oligomers (BBZ14-BBZ37) which were synthesised by automated phosphoramidite chemistry. Apart from Met-1, it has the same sequence as natural mature streptovidin protect produced by Streptomyces avidinii.

                                                                      The invention relates to a method of effecting degeneration of a somatic plant tissue by expressing a heterologous protein capable of binding a plant tissue by factor (PEF), in somatic plant tissue cells, where heterologous protein expression causes depletion of the PEF so the plant viability is maintained, while simultaneous degeneration of the somatic plant tissue is effected. This sequence represents the Streptomyces avidinii mprost protein as an example of a heterologous protein introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in finite producing plants so as to increase the number of fruits which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Degeneration of somatic plant tissue by expression of a heterologous protein, useful for controlling plant development and morphology, such as decreasing the number of flowers present to increase the number of

                                                                                                                                                                                                            The invention relates to a method of effecting degeneration of a somatic plant tissue by expressing a heterologous protein capable of binding a plant tissue by expressing a heterologous protein capable of binding a heterologous protein expression causes depletion of the PEF so the plant viability is maintained, while simultaneous degeneration of the somatic plant tissue is effected. This sequence represents the Streptomyces avidini prost protein as an example of a heterologous protein introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants so as to increase the number of fruits which reach maturity.
Degeneration of somatic plant tissue by expression of a heterologous protein, useful for controlling plant development and morphology, such as decreasing the number of flowers present to increase the number of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  90 NKRTQPTFGFTVNWK----FSESTTVFTGQCFIDRNGKEV-LKTMWLLRSSVNDIGDDWK 144

The sequence is that of streptavidin from S.avidinil. Streptavidin may be expressed from a fusion gene comprising its coding gene and DNA encoding a target protein of interes, where he streptavidin has binding sites for biotin or deriv. The streptavidin has 4 binding sites free for biotin, and is produced free of biotin and is produced free of biotin site-directed mutagenesis. The fused gene may also be produced by site-directed mutagenesis. The fused gene may be used to produce labelled, chemically-modified proteins in vivo, and to isolate proteins when only the sequence of the gene is known.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                90 NKRTOPTFGFTVNWK----FSESTTVFTGQCFIDRNGKEY-LKTMWLLRSSVNDIGDDWK 144
